

We are the

Leatherback Turtles.

We are record-breaking ocean swimmers.

We travel as far as 10,000 kilometres in search of clouds of delicious jellyfish.

No one knows how we do it, but after all our ocean roving, we can find our way back to the same beach where we were born years before, ready to lay our own eggs there.

We are the

Monarch Butterflies.

We are clouds of fluttering, orange beauty.
Few other insects travel as far as we do.

We make our way from Canada and northern USA,
down to the coasts of California and Mexico:
millions of butterflies, all travelling south.

When we reach our winter home,
we hang in clusters from the trees
and sleep until spring.

At the end of summer,
fattened on nectar,
we swarm into the sky.
